

UNITED STATES PATENT AND TRADEMARK OFFICE

Applicant: Kao et al. Docket No: 16405-0311
Serial No: 09/256,265 Group Art Unit 2815
Filing Date: February 23, 1999 Examiner: Diaz, J.
Title: **"METHOD AND APPARATUS FOR SPLIT GATE SOURCE SIDE
INJECTION FLASH MEMORY CELL AND ARRAY WITH
DEDICATED ERASE GATES"**

Attn: Examiner J. Diaz

PROPOSED CHANGES TO CLAIMS**In the Claims:**

- 1 1. (Twice Amended) A semiconductor device having at least one transistor, the device
2 comprising:
3 a substrate having a channel region defined thereon;
4 a first insulating layer disposed over said channel region and over at least a portion of
5 said substrate;
6 a floating gate generally disposed over said channel region and separated therefrom by
7 said first insulating layer, said floating gate having at least two side walls and a top surface;
8 a second insulating layer disposed over said side walls and over said top surface of said
9 floating gate;
10 a control gate formed over a first one of said side walls and over at least a portion of said
11 top surface of said floating gate and being separated from said floating gate by said second
12 insulation layer, at least a portion of said control gate being disposed over a portion of said
13 substrate and being separated therefrom by said second insulating layer;
14 an erase gate formed over a second one of said side walls and over at least a portion of
15 said top surface of said floating gate and being separated from said second one of said side walls
16 by said second insulation layer, and wherein a portion of said control gate is not disposed over
17 said floating gate;
18 a drain region formed in a portion of said substrate proximate said control gate; and

19 a source region formed in a portion of said substrate proximate said erase gate.

1 8. (Once Amended) A memory array disposed on a substrate comprising a plurality of memory
2 cells each having a floating gate separated from said substrate by a first insulating layer, an erase
3 gate, a control gate separated from said floating gate by a second insulating layer, a source
4 region, and a drain region, comprising:

5 a plurality of rows and columns of interconnected memory cells wherein the control gates
6 of memory cells in the same row are connected by a common word-line, the erase gates of the
7 memory cells in the same rows are connected by a common erase line, the source regions of the
8 memory cells in the same rows are connected by a common source line, and the drain regions of
9 memory cells in the same columns are commonly connected via a common drain line, wherein at
10 least a portion of each said control gate is disposed over a portion of said substrate and separated
11 therefrom by said second insulating layer, and wherein a portion of said control gate is not
12 disposed over said floating gate; and *Lo Col. 13, lines 55-61 of Middelhoeke et al. U.S. Pat. 5,216,269*

13 control circuit connecting to said word-lines, erase lines, source lines and drain lines for
14 operating one or more memory cells of said memory array.

1 16. (Once Amended) A semiconductor device having at least one transistor, the device
2 comprising:

3 a substrate having a channel region;

4 a first insulating layer disposed over said channel region and over at least a portion of
5 said substrate;

6 a floating gate generally disposed over said channel region and separated therefrom by
7 said first insulating layer, said floating gate having at least two side walls and a top surface;

8 a second insulating layer disposed over said side walls and over said top surface of said
9 floating gate;

10 a control gate formed over a first one of said side walls and over at least a portion of said
11 top surface of said floating gate and being separated from said floating gate by said second
12 insulation layer, at least a portion of said control gate being disposed over a portion of said
13 substrate and being separated therefrom by said second insulating layer, and wherein a portion of
14 said control gate is not disposed over said floating gate;

15 an erase gate formed over a second one of said side walls and over at least a portion of
16 said top surface of said floating gate and being separated from said second one of said side walls
17 by said second insulation layer;
18 a source region [drain region] formed in a portion of said substrate proximate said erase
19 gate; and
20 a drain region [source region] formed in a portion of said substrate proximate said control
21 gate.
